# CUSCO LSD

## Limited Slip Differentials

**BUG** **BLOB** **HAWK**

**RS Spring**  
In the RS Model, the activation pressure is applied to the same direction of the initial torque with the utilization of coil springs. Therefore, it enables a smoother and quicker initial clutch plates engagement from a non operational to a fully functioning state, even with a low initial torque setting. The virtues of a low initial torque setting is that it enables a smooth turn even while the LSD mechanism is not activated. Because of the coil spring design, it provides overall gentle and stable operation.

The MZ model LSD is designed where the activation pressure opposes the activation pressure of the initial torque with the utilization of a cone spring. The LSD operation first becomes engaged when the opposing pressures start working against one another.
